The book closes with an analysis of the hidden psychological mechanisms that underlie our current understanding of reality and its implications for the way we relate to the micro, macro, and quantum worlds. The main objections to idealism are systematically refuted and empirical evidence is reviewed that corroborates the formulation presented here. The Case shows how, from physics and neuroscience, to philosophy, art, literature, and social traditions, we can learn about the nature of reality by exploring the infinite possibilities of human thought. Jung emphasized the importance of understanding the unconscious mind, and his work has had a profound impact on fields ranging from psychology to literature. The present book scrutinizes Jung’s work to distil the unique, hidden metaphysical treasure: for Jung, mind and world are one and the same entity; reality is fundamentally experiential, not material; the psyche builds and maintains its body, not the other way around; and the ultimate meaning of our sacrificial lives is to serve God by providing a reflecting mirror to God’s own instinctive mentation. Embodied in this compact volume is a journey of discovery through Jungian thoughtscapes never before revealed with the depth, force and scholarly rigor you are about to encounter.
